

1. OVERVIEW BY STUDY CHARACTERISTICS (n = 36)

A

MOVEMENT TYPE

Total Studies (n = 36)

Gait-related Analysis	18 (50.0%)
Stereotyped Motor Movements (SMMs)	7 (19.4%)
Fine Motor Movements	4 (11.1%)
Hand/Wrist Movements	3 (8.3%)
Gesture Patterns	3 (8.3%)
Other / Whole-body	1 (2.8%)

B

METHODOLOGICAL APPROACH

Total Studies (n = 36)

Traditional / Classical ML	20 (55.6%)
Deep Learning	12 (33.3%)
Hybrid (ML + DL / Transformers, etc.)	2 (5.6%)
Statistical / Validation	2 (5.6%)

C

LEARNING TYPE

Total Studies (n = 36)

Supervised Learning	34 (94.4%)
Statistical / Validation	2 (5.6%)

Gait analysis is the most frequently investigated movement type, covering nearly half of the included studies (50.0%).

Traditional machine learning approaches remain the most commonly used (55.6%), followed by deep learning methods (33.3%).

Supervised learning is dominant in the literature (94.4%).

2. PERFORMANCE SUMMARY

AVERAGE PERFORMANCE
(ACCURACY OR EQUIVALENT)

90.9%

(Based on 33 studies reporting percentage-based performance)

PERFORMANCE DISTRIBUTION (BY PERCENTAGE-BASED METRICS)

PERFORMANCE RANGE SUMMARY (n = 33)

Performance Range	Number of Studies	Percentage
< 80%	2	6.1%
80-89%	9	27.3%
90-94%	9	27.3%
≥ 95%	13	39.4%

More than one-third of the studies (39.4%) report high performance (≥95%), highlighting the potential of AI methods for movement-based ASD analysis.
